

# Keys In DBMS

## Keys

Keys play an important role in the relational database. It is used to uniquely identify any record or row of data from the table.

## Types of Keys

- Primary Key
- Candidate Key
- Super Key
- Foreign Key
- Alternate Key
- Composite Key.

PERSON
Name
DOB
Passport-Number
License-Number
SSN

## 1. PRIMARY KEY

It is the first key used to identify one and only one instance of an entity uniquely. An entity can contain multiple keys, as we saw in the person table. The key which is most suitable from those lists become a primary key.

In the EMPLOYEE table, ID can be the primary key since it is unique for each employee. In the EMPLOYEE table, we can even select License-Number and Passport-Number as primary keys since they are also unique.

EMPLOYEE
Employee-ID → Primary Key
Employee-Name
Employee-Address
Passport-Number
License-Number
SSN

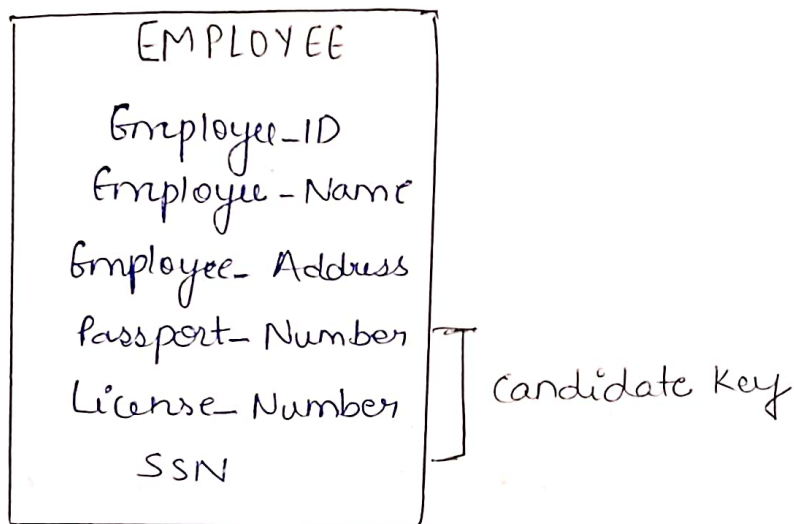

## 2. CANDIDATE KEY

A Candidate key is an attribute or set of attributes that can uniquely identify a tuple.

Except for the primary key, the remaining attributes are considered a candidate key.

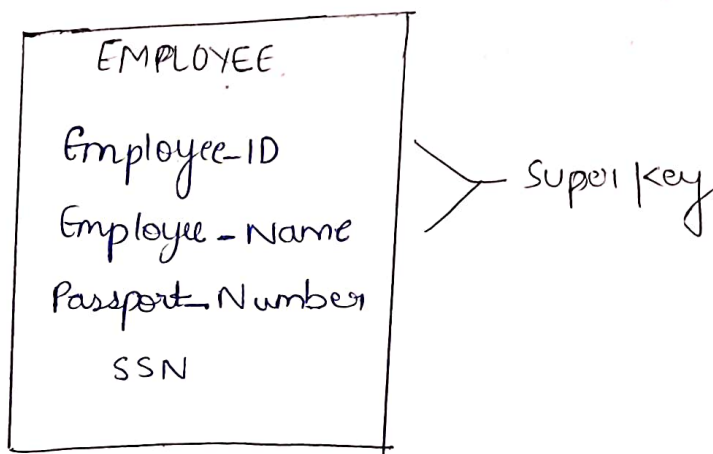

The candidate keys are as strong as the primary key.

For example: In the EMPLOYEE table, id is best suited for the primary key. The rest of the attributes, like SSN, Passport-Number, License-Number, etc., are considered a candidate key.

## 3. SUPER KEY

Super Key is an attribute set that can uniquely identify a tuple. A Super Key is a superset of a candidate key.

For example: In the above EMPLOYEE table, for (EMPLOYEE-ID, EMPLOYEE-NAME), the name of two employees can be the same, but their EMPLOYEE-ID can't be the same. Hence, this combination can also be a key.

The Super Key would be EMPLOYEE-ID (EMPLOYEE-ID, EMPLOYEE-NAME), etc.

#### 4. FOREIGN KEY

Foreign Keys are the column of the table used to point to the primary key of another table.

Every Employee works in a specific department in a company, and Employee and department are two different-entities.

So we can't store the department's information in the Employee table. That's why we link these two tables through the primary key of one table.

We add the primary key of the DEPARTMENT table, Department-ID, as a new attribute in the EMPLOYEE table.

## 5. Alternate Key—

There may be one or more attributes or a combination of attributes that uniquely identify each tuple in a relation.

These attributes or combinations of the attributes are called the candidate keys. One key is chosen as the primary key from these candidate keys, and the remaining candidate key, if it exists, is termed the alternate key.

$$\boxed{\text{Alternate Key} = \text{Candidate Key} - \text{Primary Key} .}$$

For example; employee relation has two attributes, Employee-id and PAN-NO, that act as candidate keys.

In this relation, Employee-id is chosen as the primary key, so the other candidate key, PAN-NO, acts as the Alternate key.

## 6. Composite Key—

Whenever a primary key consists of more than one attribute, it is known as Composite key. This key is also known as Concatenated Key.
